

Certyfikat PMP® Exam Breakdown

Planning Project Quality

Designing perfection into the process, not inspecting it after the fact.

dr Zbigniew Galar

THE QUALITY IMPERATIVE

Quality dictates whether stakeholder expectations were truly met. Delivering a project on time and exactly on budget is meaningless if you deliver the wrong product or an inferior solution.

EXAM SPOTLIGHT

NOTE

Quality must be planned, designed, and built in—not inspected.

THE EXAM TRAP: QUALITY VS. GRADE

GRADE: A category of product/service with different technical characteristics.

QUALITY: How well the product fulfills the required specifications.

QUALITY

GRADE

(Low to High - Number of Features/Technical Characteristics)

BLUEPRINT EXAMPLE: DAD'S DOLLARS CREDIT CARD SOFTWARE

ACCEPTABLE: Low Grade (few features) but High Quality (zero bugs, performs as advertised).

UNACCEPTABLE: Low Quality is always an unacceptable project condition.

THE QUALITY PLANNING ECOSYSTEM

The Scope Baseline is the foundational blueprint. It dictates exactly what is being built, which directly determines the quality standards required.

EXAMP

The Quality Policy is an OPA dictated by executive management. If none exists, the project team must create one and distribute it to all key stakeholders.

NAVIGATING THE RULES

STANDARDS

Nature: Voluntary guidelines / Best practices

Source: Independent bodies, ISO, PMI

Example: ADA website viewing options, ISO protocols.

Consequence: Disregarding them means products may be unusable or rejected by the market.

STAMPP

REGULATIONS

Nature: Mandatory strict adherence

Source: Governments, Institutions (e.g., AMA)

Consequence: Stiff penalties, fines, or jail time.

THE ECONOMICS OF QUALITY

It is substantially cheaper and more efficient to prevent defects upfront than to spend time and money fixing them later.

THE COST OF QUALITY (COQ) FRAMEWORK

CONFORMANCE INVESTMENT

Definition: The total cost to produce a product to standards plus the cost incurred when requirements are not met.

Cost of Conformance
Money spent during the project to avoid failures.
(Prevention & Appraisal)

Cost of Nonconformance
Money spent during and after the project because of failures.
(Internal & External Failure)

NONCONFORMANCE FAILURE

**Exam Spotlight**

Both planned and unplanned work necessary to meet product requirements count toward COQ.

CONFORMANCE: BUILDING THE SHIELD

PREVENTION COSTS (Keeping defects away from customers)

APPRAISAL COSTS (Examining the product)

BUSINESS REALITY

BECAUSE PROJECTS HAVE LIMITED DURATIONS, THESE CONFORMANCE COSTS ARE OFTEN PASSED ON TO THE ACQUIRING ORGANIZATION.

NONCONFORMANCE: THE PRICE OF FAILURE

INTERNAL FAILURE COSTS (Caught before delivery)

Requirements missed while product is still in organizational control.

Examples: Rework, scrapping defective parts, process downtime, corrective actions.

WARNING:
ORGANIZATIONAL
IMPACT

EXTERNAL FAILURE COSTS (Caught by the customer)

Requirements missed and discovered in the field.
The absolute worst-case scenario.

Examples: Warranty work, product returns, liabilities, lost business, customer site inspections.

MARKET IMPACT

THE PIONEERS OF QUALITY

THE ARCHITECTS OF QUALITY

THE ENGINE OF CONTINUOUS IMPROVEMENT

WALTER SHEWHART

The grandfather of **TQM**. Invented **statistical control chart techniques** to identify when corrective action is needed, and created the **PDCA** (Plan-Do-Check-Act) cycle.

THE KAIZEN APPROACH

Origin: Japan (Continuous Improvement).

Philosophy: Improve the quality of the people first, then the quality of the products.

Action: Everyone watches for incremental ways to improve, making processes repeatable, systemized, and reducing variation.

SIX SIGMA METHODOLOGIES

The Target: A measurement-based strategy focused on extreme variation reduction, aiming for no more than 3.4 defects per million opportunities.

CAPABILITY MATURITY MODEL INTEGRATION (CMMI)

Purpose: Assessing and improving organizational performance maturity.

The PMBOK® Quality Mindset

Synthesis: Passing the exam—and successfully managing projects—requires adopting a singular, unified philosophy on quality:

Blueprint Finalized

Closing Thought: Your quality plan is the foundation of stakeholder trust. Prevent the defect, protect the project.

Takeaway: Master the distinction between grade and quality, own the cost of conformance, and engineer continuous improvement.
